## APPENDIX D THE LARGE "n", NON-CLINICAL SURVEYS OF BOULTON & PARK SOCIETY

• Transgender Research Project raw data

## • Women in Relationships with Cross-Dressing Men, George R. Brown, M.D.

The Boulton & Park Society is a transgender organization based in the San Antonio, Texas, area. It has been host to six annual "Texas T-Parties" (the seventh is scheduled for 21 - 26 February 1995) which have become the largest gatherings of transgendered people (usually over three hundred and fifty of which over seventy-five are married spouses) in the world.

Boulton & Park is named after the original Stella Boulton and Fannie Park who were scandalized by London's Bobbies (but convicted of nothing after a week-long hearing) in the 1870's for crossdressing. Their account appears in detail in <u>Men In Petticoats</u>, Karn Publications, Garston, 63 Salisbury Road, Garston, Liverpool LI 09H, England.

B&P's Executive Director is Cynthia Phillips (spouse) and its Secretary is Linda Phillips (transgendered). They may be reached at PO Box 17, Bulverde, Texas 78163, USA phone 210/980-7788.

## THE SIGNIFICANCE OF THEIR SURVEY WORK, AS PRESENTED IN THIS APPENDIX, IS THAT THE DATA HAS A VERY LARGE "n" AND IT IS GATHERED FROM A NON-CLINICAL SETTING!

The medical literature on the transgender community, with scantly few exceptions (if any at all), are derived from data gathered in the clinical setting. Cynthia and Linda (and former B&P President Tere A. Frederickson who designed the transgender research project and developed the surveys) believe strongly, as do many transgenders, that different medical literature conclusions will arise if the data are taken from non-clinical settings. Their assertion is that most transgenderes are neither ill nor "dysphoric", do not need counseling, and therefore, do not appear in the medical data base. Their assertion is that the medical literature and its heavily skewed clinical data based conclusions are very badly and negatively biased as a result.

The survey presented herein has an extremely large "n" of 934: all were gathered from non-clinical settings.

Following the survey is the first page of "Women in Relationships with Cross-Dressing Men: A Descriptive Study from a Nonclinical Setting" by George R. Brown, MD, which appears in the "Archives of Sexual Behavior," Vol 23, No 5, October 1994. Of significance is the large "n" of 106 and that these were done by Boulton & Park in a non-clinical setting.

# Road Lough Contract Road Lough Contract Status 4 200 TRANSGENDER RESEARCH QUESTIONNAIRE

<sup>N</sup>The Boulton & Park Society has completed this survey with the help of Dr. George R. Brown, M.D. a pioneer in the field of transgendered behavior. Dr. Brown was ably assisted by our group facilitator, Gina Brooks, M.A.

The bulk of the work in this over three-year long research project was done by members of The Boulton & Park Society. The Boulton & Park Society is a non-profit transgendered outreach organization dedicated to providing knowledge of the transgendered experience, not only to society at large but to members of the transgendered community as well.

This is the largest, to date, research survey done by the transgendered community. There have been many surveys and questionnaires done about and for our community, but none as comprehensive as this done by transgendered people.

You will find many questions answered by transgendered people which may seem counter to answers you may find in like questions in surveys conducted by professionals in the field of transgender research. We feel the difference is in the "at ease" factor. Participants were approached to do this survey by members of their own community. There was no "clinical" approach.

A large number of participants were contacted through the many events given throughout the country by the transgender community. Others by assistance of the various transgendered support groups through their newsletter contact point. Without the kind assistance of our sister groups, this survey would have not been possible.

Because of this assistance from the gender community as a whole, this survey has received literally nationwide attention with responses from fifty-one states and several foreign countries. Our total response (to date) has been nine hundred, thirty-four.

We feel this is a ground-breaking survey on the transgender community. Because of a limited involvment by professionals who are more involved than most in our community, are feel there is less danger of pre-judgment according to wrongly preconceived theories about the transgendered experience.

The transgender community has been the object of much research by the medical community. We, at The Boulton & Park Society, have felt for some time it would be of benefit to our community, as well as the professionals involved in our community, to conduct our own survey. Many times the transgendered individual gives information to professionals based on what he thinks they want to hear. The Boulton & Park Society feels this survey removes that stigma.

In this survey we hope both lay-person and professional alike will learn something about our unique culture.

The Boulton & Park Society wants to thank not only Dr. George Brown, and Gina Brooks for their invaluable help in this survey, but the hundreds of transgendered individuals who gave their time and energy to help enlighten anyone interested in one of the most fascinating aspects of human behavior

THE BOULTON & PARK SOCIETY

## Women in Relationships with Cross-Dressing Men: A Descriptive Study from a Nonclinical Setting

George R. Brown, M.D.<sup>1,2</sup>

Over a 6-year period, 106 women involved with men who cross-dress (mostly heterosexual transvestites) completed a questionnaire regarding themselves, their male partners, and their relationships. Interview data supplemented these questionnaires for 75% of the respondents. All respondents were recruited from nonclinical settings. The "modal" female partner was a 40-year-old Protestant, Caucasian woman, who was a firstborn child, in her first marriage. She was more likely than other women her age to be childless, and to have earned at least a 2-year college degree. She was no more likely to have had lesbian experiences or substance use problems than comparably aged American women. She had been married to her cross-dressing mate for 13 years and had known of his activities for 9 years. A quarter of women reported at least occasional sexual arousal to their mate's cross-dressing. The two variables associated with low acceptance of cross-dressing were discovery of their partner's cross-dressing after marriage and lack of sexual arousal to cross-dressing stimuli. Low acceptance was unrelated to firstborn status, amount of exposure to cross-dressing activities, or having had children. This group may be more representative of women in relationships with cross-dressing men than previous reports limited to cross-dressers and spouses who are in treatment.

KEY WORDS: transvestism; women; transgendered; nonclinical.
